

System and Organization Controls (SOC) for Cybersecurity Webinar

Overview

This webinar will provide a high-level overview of the System and Organization Controls (SOC) for Cybersecurity reporting framework. Cybersecurity incidents are extremely costly to organizations and have a negative impact on stakeholder trust in the organization. In response to concerns that stakeholders do not have enough timely information regarding an organization's cybersecurity risks and risk management efforts, the American Institute of Certified Public Accountants (AICPA) recently developed a cybersecurity risk management reporting framework to guide organizations in enhancing their cybersecurity-related disclosures. The reporting framework, (SOC) for Cybersecurity, helps organizations communicate to stakeholders about their cybersecurity risk management programs and provides a basis for a cybersecurity examination. The reporting framework is flexible and allows criteria such the NIST Critical Infrastructure Cybersecurity Framework and ISO 27001/27002 to be used as the control criteria.

Objectives

To gain an understanding of:

- the threats and impacts that cybersecurity breaches have on organizations
- the SOC for cybersecurity risk management reporting framework
